VANMITRA-AI

Theme & UI Style Guide

Light / Dark visual system • Flutter implementation handoff

Purpose: provide a single visual reference for implementing and reviewing the app theme across Dashboard, Claims, Gram Sabha, Atlas Map, and Profile/Settings.

SOURCE NOTE

This guide is derived from the screenshots supplied in this conversation. Color hex values are reference tokens approximated from the visuals and should be reconciled with the project ThemeData/ColorScheme before becoming code constants.

1. Theme overview

VanMitra-AI uses a public-service / environmental governance visual language built around forest green, warm orange, white/light surfaces, and restrained status colors. The same design language should remain stable across Marathi and English content.

Core design principles

- Forest-first: green anchors the product identity and the primary navigation/header.
- Orange as action: use orange for primary calls to action, active controls, progress emphasis, and important interactive affordances.
- Clear hierarchy: cards and surfaces separate content without excessive decoration.
- Dark mode is a full visual theme: surfaces, text, navigation, controls, and states all change together.
- Operational readability: body text, labels, values, Marathi content, and system status must remain legible in field conditions.

Theme modes

Mode	Base surface	Primary text
Light	#F4F7F5 / white cards	#13202B
Dark	#0C1B14 / #173425 cards	#F4F7F5

2. Color system

Reference palette for designers and Flutter developers. Prefer ThemeData + ColorScheme tokens so every screen inherits the same semantics.

Token	Reference	Use	Notes
brand.primary	#1A4331	Header, navigation, branded surfaces	Core forest green
brand.primaryDark	#0C1B14	Dark app background / deep surfaces	Use for dark page scaffolding
brand.secondary	#2D765C	Secondary green surfaces, icons	Supportive brand accent
accent.primary	#FF8D20	Primary buttons, active states, progress	Warm action orange
accent.dark	#D96B00	Pressed/strong orange states	Use sparingly
light.background	#F4F7F5	Light page background	Soft neutral, not pure white
light.surface	#FFFFFF	Light cards / elevated surfaces	Primary light surface
dark.surface	#173425	Dark cards / tiles	Lift from page background
dark.background	#10261B	Dark page / content background	Deep green-black
dark.border	#2B5A46	Dark card borders / separators	Low-contrast structure
text.primary		Light mode headings/body	Near-black navy

text.muted	#66737C	Light mode secondary text	Use for metadata
text.onDark	#F4F7F5	Dark mode headings/body	White/off-white
text.mutedDark	#AAB8B2	Dark mode secondary text	Muted but readable
status.success	#5FAE3B	Synced / stable	Positive system state
status.warning	#F0B323	Amber / pending	Warnings and review state
status.error	#D7262E	Critical / error	Critical alert state
status.info	#2F5FB3	Informational state	Use where current UI already does

Color usage rules

- Do not use pure black text on dark green surfaces.
- Do not keep white cards in Dark Mode unless the component is intentionally designed as an alert/exception.
- Selected bottom navigation uses orange in Dark Mode; unselected items use muted light grey.
- Status colors communicate state; they are not general-purpose decoration.
- Keep green/orange branding consistent across both language modes.

3. Typography & content hierarchy

The screenshots show a clean, sans-serif hierarchy with strong, compact headings and generous readability for operational text. Marathi and English should share the same semantic hierarchy.

Element	Size	Weight	Contrast	Use
App / screen title	20–24 px	Bold / 700	High contrast	Header / major section title
Section heading	17–20 px	SemiBold / 600–700	High contrast	e.g. Admin Governance Operations
Card title	15–18 px	SemiBold / 600–700	High contrast	Statistic & action card titles
Primary value	28–34 px	Bold / 700	Brand or primary text	Dashboard counts
Body / supporting	13–16 px	Regular / 400–500	Secondary contrast	Descriptions / metadata
Caption / metadata	11–13 px	Regular / 400–500	Muted	Dates, IDs, helper text
Button label	14–16 px	SemiBold / 600–700	High contrast	Primary actions

Marathi / English handling

- Use one semantic TextStyle system for both languages; do not create separate visual hierarchies.
- Allow extra line height for Marathi when needed; never clip Devanagari glyphs.
- Keep the current bilingual pattern (e.g. “Language Selection / □□□□ □□□□”) where the product calls for it.

4. Component theming rules

Component	Surface	Text	Accent	Rule
App header	Forest green / deep green	White/off-white title; muted green-white metadata	Orange circular settings button outline where present	Header remains branded in both modes
Profile hero	Green gradient/surface family	White/off-white	Orange avatar / accents	Primary identity block
Cards	White or soft neutral	Dark primary / muted secondary	Orange, green, blue, or status accent icons	Dark mode uses elevated dark surfaces
Primary button	Orange	White	Orange/pressed orange	Use for actions such as Schedule Meeting, Sync
Secondary / outlined	Transparent or surface	Primary text	Green/orange border	Avoid excessive outline density
Bottom navigation	White/light surface	Dark or muted text	Active green in light; active orange in dark	Dark mode bar must become dark too
Inputs / search	White/neutral	Dark / muted	Green/orange focus ring	Dark mode: dark surface + light text
Chips / filters	Light tinted surface	Primary text	Selected uses brand/status color	Maintain clear selected state
Dialogs / bottom sheets	Surface	Theme text	Orange primary action	Must follow active theme

Map overlays	Surface above map	High contrast	Status colors + orange actions	Underlying satellite imagery stays intact

Shape, spacing & elevation

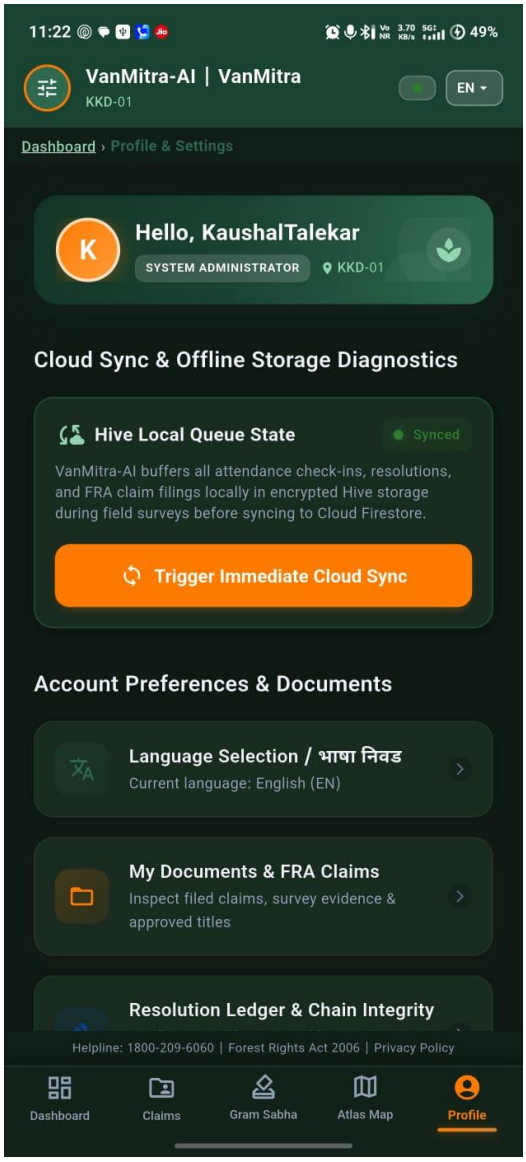

- Use rounded rectangles consistently; the product commonly uses medium-to-large corner radii.
- Keep cards visually separated using spacing rather than heavy borders.
- Use soft shadows in Light Mode. In Dark Mode, prefer subtle elevation or low-contrast borders over large bright shadows.
- Maintain the compact 5-item bottom navigation and consistent horizontal padding used by the current app.

5. Screen reference gallery

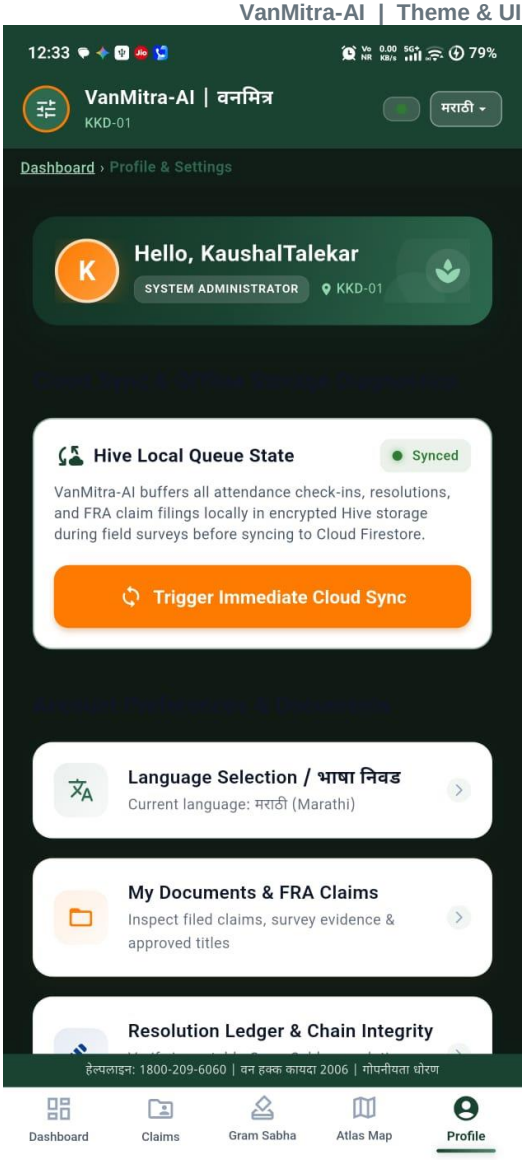

The following supplied screenshots are included as visual anchors for the theme system.

Light Dashboard

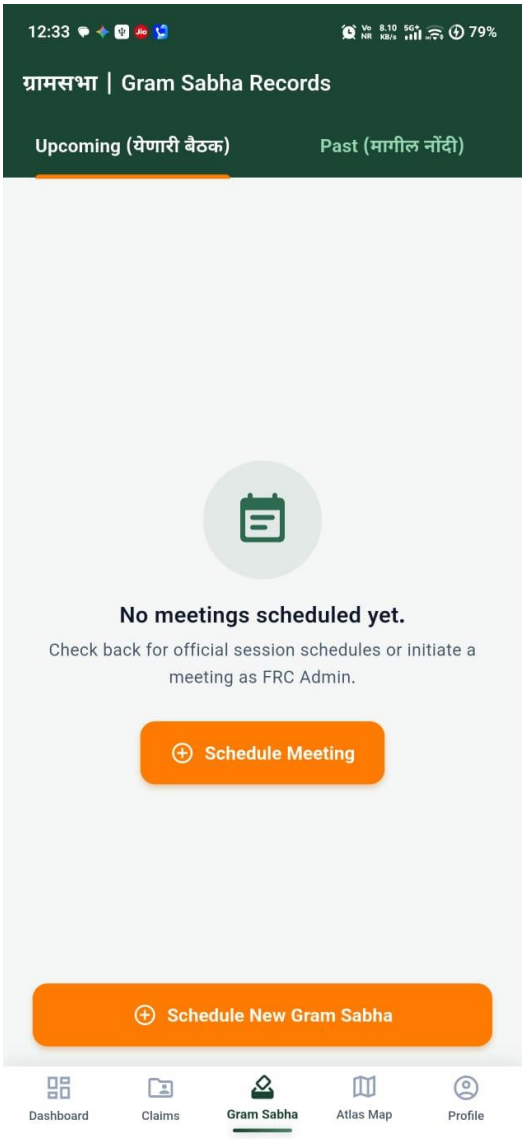

Dark Dashboard

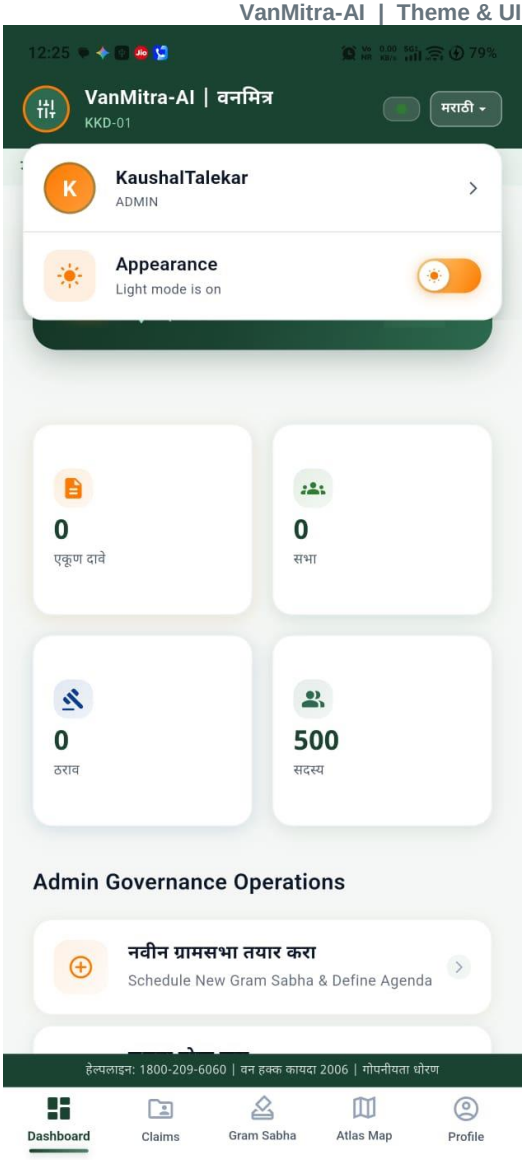

Dark Profile / Settings

Claims

Gram Sabha

Atlas Map

IMPLEMENTATION REFERENCE

Use these screenshots to spot inconsistent hardcoded colors during review. In Dark Mode, the expected change is not only the page background: card surfaces, text, icons, controls, and bottom navigation should all inherit the active theme.

6. Screen-by-screen theme checklist

Screen	Audit targets	Expected dark-mode behavior
Dashboard / Home	Hero, statistic cards, governance operation cards, header, status labels, footer, bottom navigation	Dark background + dark cards + white primary text + orange/green actions
Claims	Search bar, filter chips, claim cards, status pills, floating action button, stepper	Dark surfaces; status colors preserved; metadata remains readable
Gram Sabha	Green tab header, empty state,	Dark content surface; green header can remain branded; text and empty-state

	calendar/meeting imagery, action buttons	panel must adapt
Atlas Map	Map controls, filters, alert card, buttons, bottom navigation	Map imagery stays natural; UI overlays theme to active mode
Profile / Settings	Hero card, diagnostics panel, account preference cards, settings dropdown	Settings and cards follow the same theme tokens; language preference belongs in the settings dropdown

7. Flutter implementation contract

Recommended architecture for keeping the theme consistent throughout the app:

- Define Light and Dark ThemeData centrally.
- Expose semantic tokens through ColorScheme / ThemeExtension where the default ColorScheme is insufficient.
- Use Theme.of(context) inside reusable components instead of hardcoding screen-specific UI colors.
- Keep status colors semantic (success, warning, error, info) rather than tied to a screen.
- Keep the theme toggle in one source of truth and ensure rebuilds propagate through the entire MaterialApp/CupertinoApp tree.
- Avoid creating local duplicate “isDark” states inside individual screens.
- Audit Colors.white / Colors.black / fixed greys after any theme refactor.

Suggested semantic tokens

background, surface, surfaceContainer, surfaceElevated, primary, secondary, onBackground, onSurface, onSurfaceVariant, outline, success, warning, error, info, **actionPrimary, navSelected, navUnselected**

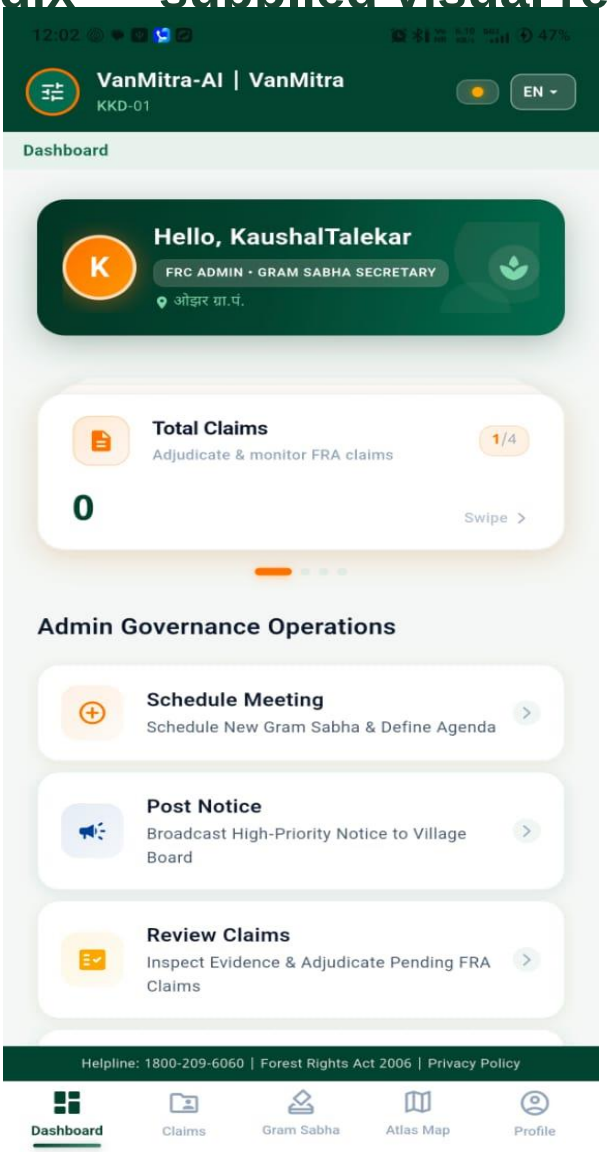

8. Theme QA checklist

- Toggle Light → Dark → Light without app restart.
- Verify Dashboard, Claims, Gram Sabha, Atlas Map, and Profile all update in the same interaction.
- Check that no large white card or dark/black text remains unintentionally in Dark Mode.
- Check bottom navigation: dark surface, orange active item, muted-light inactive items.
- Check dialogs, dropdowns, search/input fields, chips, and floating action buttons.
- Check Marathi and English text for contrast and clipping.
- Check map overlays and alert cards on top of satellite imagery.
- Run flutter analyze and fix theme-related regressions before release.
- Review on at least one smaller Android viewport to catch overflow.

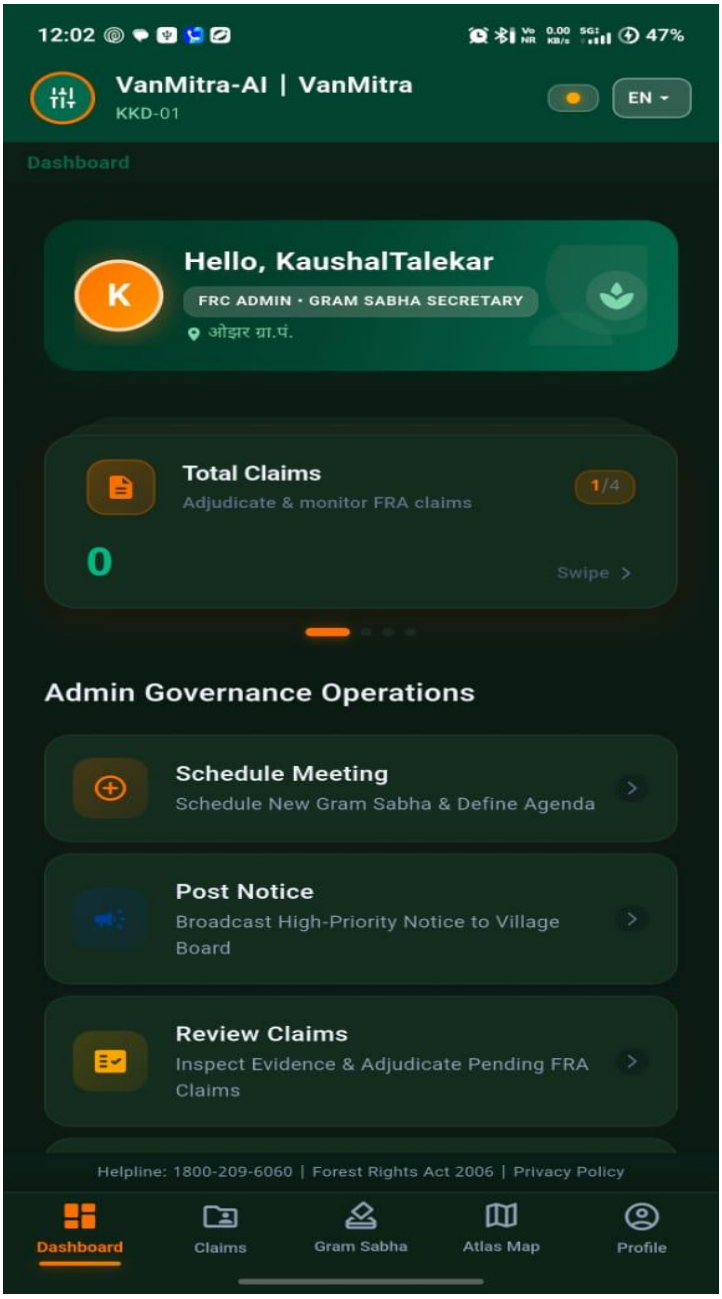

DEFINITION OF DONE

A user should be able to switch theme once and then move through every app section without encountering components that visually look “stuck” in Light Mode. Branding remains green/orange; the surface, text, navigation, and control system changes coherently.

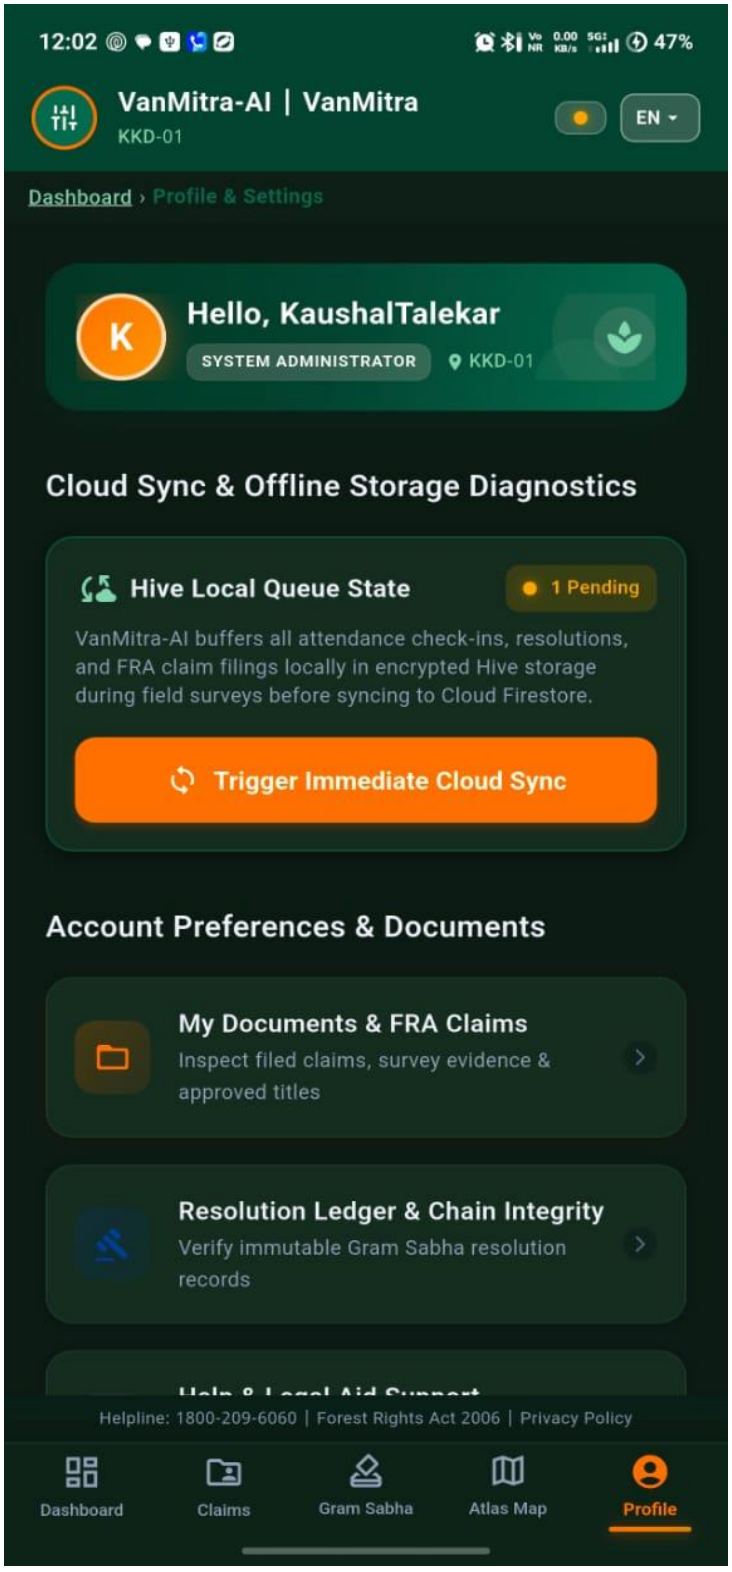

9. Appendix — supplied visual references

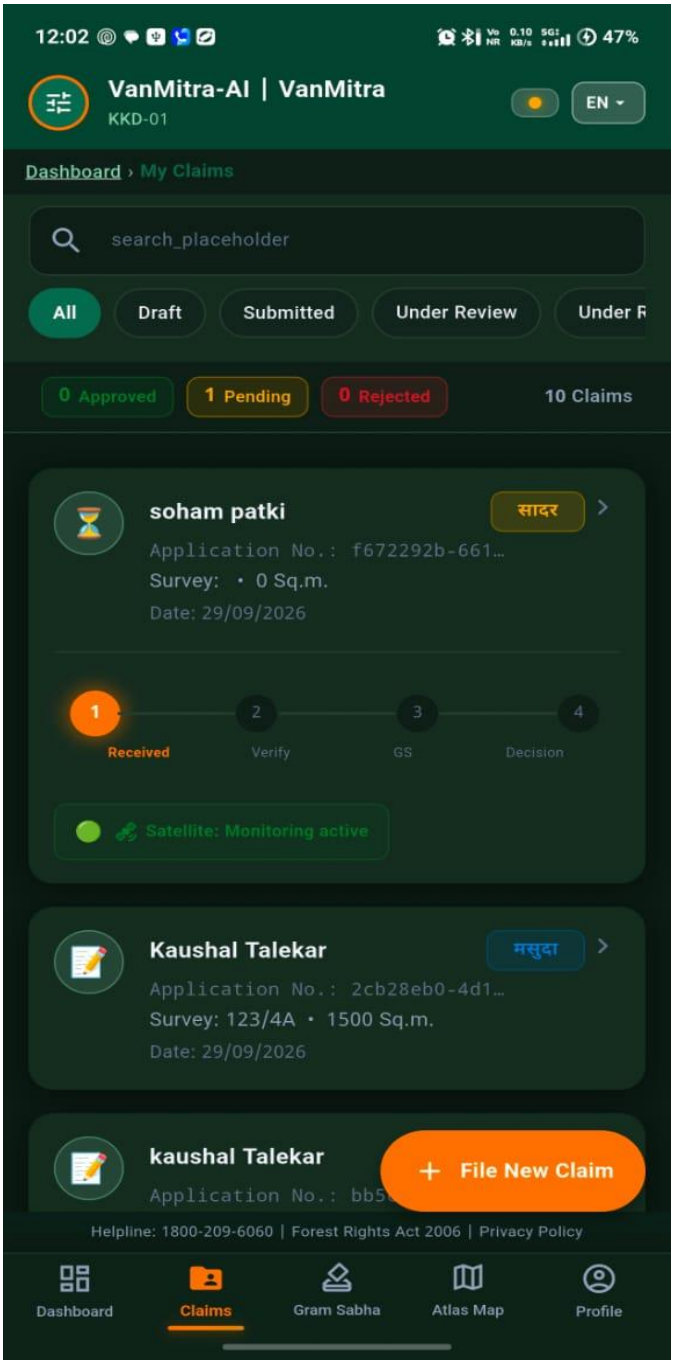

Dashboard – Light theme reference

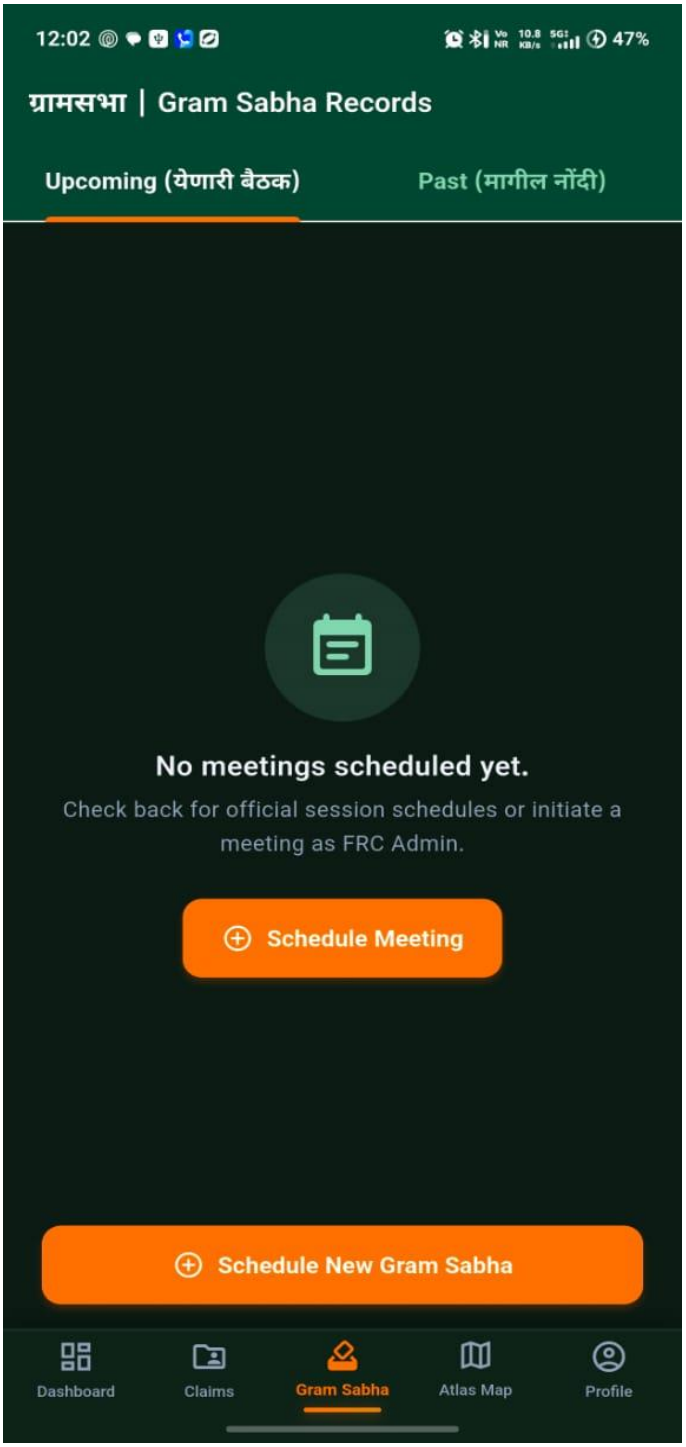

Dashboard – Dark theme reference

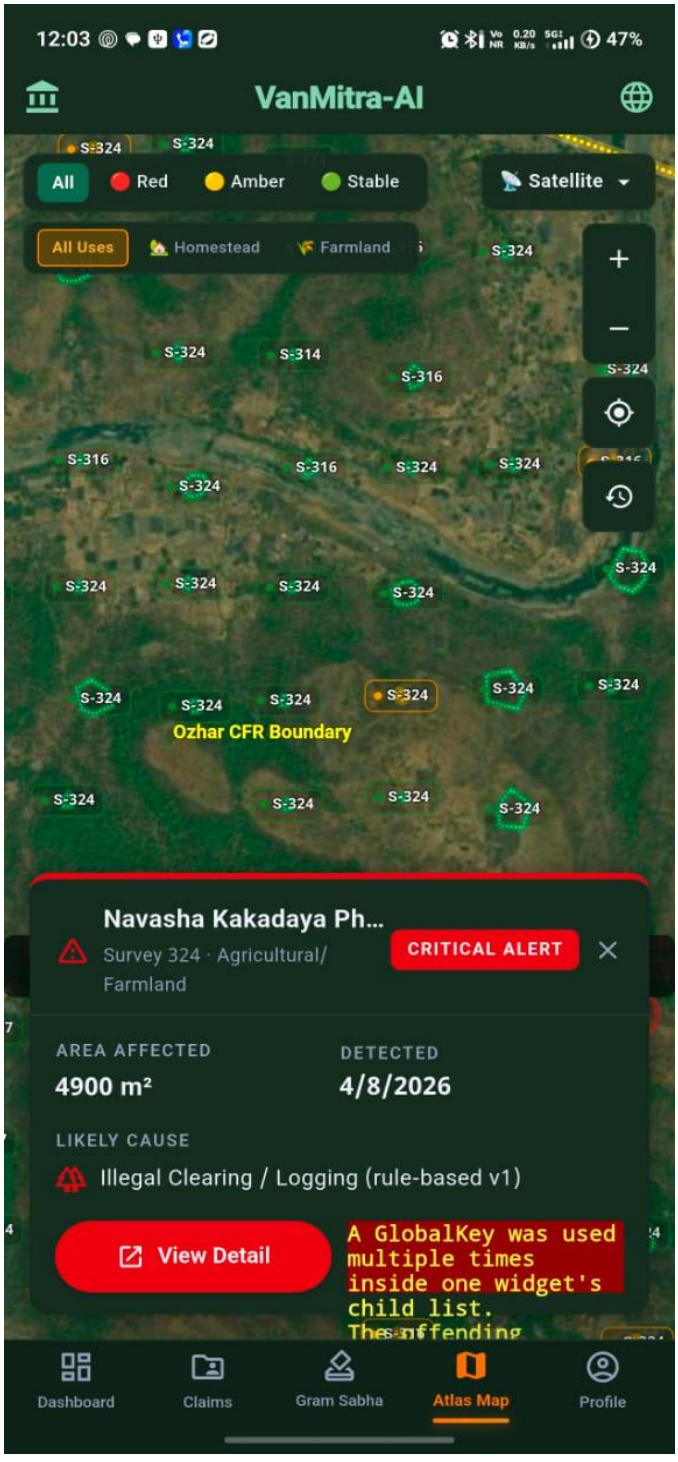

Profile – Dark theme reference

Claims – current visual reference

Gram Sabha – current visual reference

// IGNORE THE RED ERROR INNTHE BOTTOM RIGHT, IT'S A COMPILING ISSUE, IT'LL GET RESOLVED.

Atlas Map – current visual reference
